

Figure 4.17: A) GPR data from profile T2, showing the internal structure of the subdued terminal moraine B) interpretation diagram for the profile T2 showing 1) sub-parallel reflections interpreted as the ice distal slope of an ice contact fan; 2) steeply up-glacier dipping reflections interpreted as rectilinear slopes ; and 3) strong reflection interpreted as a sedimentary surface. The shadow which is shown along the entire profile, underneath the reflection is an artefact and is not interpreted as part of this profile. Insert box showing increased sinuosity of the reflections and a number of faults.
